

EVIDENCE SYNTHESIS BRIEFING NOTE

TOPIC: CONTACT TRACING FOR COVID-19

Information finalized as of June 1, 2020.^a

This Briefing Note was completed by the Research, Analysis, and Evaluation Branch (Ministry of Health) based on information provided by members of the COVID-19 Evidence Synthesis Network. Please refer to the <u>Methods</u> section for further information.

Purpose: Contact tracing is a process that is used to identify, educate, and monitor individuals who have had close contact with someone who is infected with a virus; these individuals are at a higher risk of becoming infected and sharing the virus with others. Contact tracing can help the individuals understand their risk and limit further spread of the virus. This note provides a summary of the evidence and jurisdictional experiences on contact tracing approaches to contain the COVID-19 pandemic.

Key Findings:

- No relevant evidence-based guidelines have been identified regarding contact tracing for people who have been in contact with a person with a suspected or confirmed diagnosis of COVID-19; thus, no conclusions can be drawn.
- Best practices that appear to improve the effectiveness of contact tracing across jurisdictions include:
 - High Surveillance and Contact Tracing Capacity: Well-trained and adequately staffed contact tracing teams are crucial for mounting a proactive pandemic response. Although manual contact tracing is the preferred approach, it is very resource-intensive and may rapidly become overwhelmed. Human resource capacity for contact tracing in most jurisdictions was achieved through redeployment and training of employees and volunteers across sectors (e.g., health care workers, armed forces, police).
 - Digital Contact Tracing Approaches: Bluetooth, global positioning system, and cloud-based technologies may serve as useful tools for supporting contact tracing, particularly in densely populated areas where not all contacts may be known to the infected individual.
 - However, due to privacy and usability concerns, these digital tools may best serve as supplementary measures to traditional contact tracing approaches, in which contacts are identified through a thorough review of available data (e.g., telephone interviews with the infected individual; medical, travel, or police records). This approach has been recommended by the World Health Organization.
- Enabling contextual factors that may improve the effectiveness of contact tracing across jurisdictions include:
 - **Emergency Preparedness**: Pre-existing pandemic or natural disaster emergency infrastructure facilitates a rapid whole-of-government response.
 - **Cross-Sectoral Collaboration**: An "all hands-on deck" approach facilitates a rapid and comprehensive response and supports human resource/redeployment needs for contact tracing.
 - Local Public Health Units: These units are essential for implementing contact tracing protocols, maintaining the number of cases within a manageable range, building rapport with the community, and piloting new outreach approaches (e.g., home-based testing or symptom monitoring).
 - **Science-Focused Strategic Communication**: Transparent, evidence-informed public communication, delivered by experts, builds public trust and may facilitate public cooperation with contact tracing strategies.

Analysis for Ontario:

- On April 27, 2020, the Government of Ontario released its <u>framework document</u> for reopening the province, echoing the need to strengthen public health capacity for timely contact tracing and case management.
- Public Health Ontario, in collaboration with the Ministry of Health and the Canadian federal government, is leading the COVID-19 Contact Tracing Initiative.

^a This briefing note includes current available evidence as of the noted date. It is not intended to be an exhaustive analysis, and other relevant findings may have been reported since completion.

Supporting Evidence

<u>Table 1</u> below summarizes the scientific evidence and jurisdictional experiences regarding contact tracing approaches during the COVID-19 epidemic. In terms of information on jurisdictional experience, most of the information presented is based on case study findings on how Germany, Iceland, Israel, Singapore, South Korea, and Taiwan contained the COVID-19 epidemic through rigorous contact tracing.^b Additional information on other jurisdictions was included if available.

Additional details about the case study findings from the six jurisdictions are provided in <u>Table 2</u> (for a summary of the case studies, including testing and contact tracing criteria, processes, capacity, responsible parties, and timelines) and <u>Figure 1</u> (for a summary of the features of contact tracing digital approaches) in the Appendix.

Table 1: Summary of Scientific Evidence and Jurisdictional Experiences on Contact Tracing Approaches for COVID-19

Scientific Evidence	 No relevant evidence-based guidelines have been identified regarding contact tracing for people who have been in contact with a person with a suspected or confirmed diagnosis of COVID-19; thus, no conclusions can be drawn.¹
International Scan	 Traditional Contact Tracing Approaches: Germany, Iceland, Israel, Singapore, South Korea, and Taiwan primarily rely on traditional contact tracing approaches, in which contacts are identified through a thorough review of available data (e.g., telephone interviews with the infected individual, family, and/or physician; travel or police records; credit card transactions; closed-circuit television footage). In general, contact tracing teams within local public health units call infected individuals to communicate test results and/or inquire about any contacts that occurred in the days preceding symptom onset.² Digital Contact Tracing Approaches: The most commonly used digital approaches involve smartphone applications (apps) using global positioning system (e.g., Israel, Iceland) or Bluetooth (e.g., Singapore, Australia, United Kingdom) data,^c as well as linked data and cloud-based technologies (e.g., South Korea, Taiwan).^{3,4,5} Other digital approaches include: Quick Response (QR) Codes^d added to public venues to enable identification of contacts should an outbreak occur (e.g., Singapore, New Zealand).^{6,7} For example, New Zealand's <u>NZ COVID Tracer</u> voluntary app creates a digital diary of the places users visit by users scanning QR code posters that contain information about the name and location of businesses.⁸ It is meant to support manual contact tracing conducted by public health units and the National Close Contact Service.⁹

^b The North American Observatory on Health Systems and Policies conducted six rapid jurisdictional case studies, including an environmental scan of the academic and grey literature and key informant interviews, to learn about contact tracing approaches. The six jurisdictions were selected based on the following criteria: 1) evidence of containment of COVID-19 spread which has been sustained until late April 2020 based on a declining incidence of new cases; 2) evidence of gradual easing of large-scale public health restrictions; 3) evidence of use of new technologies for case/contact management; and 4) evidence of sufficient availability of public and academic information, as well as ability to reach key informants for consultation (<u>NAO, May 2020</u>). ^c Digital apps, installed on an individual's personal mobile device, can use the phone's location data and Bluetooth signals to determine: 1) whether the individual has come into contact with someone infected with SARS-CoV-2; and 2) which individuals the infected person has come into contact with and potentially exposed (<u>NAO, May 2020</u>).

^d QR codes are barcodes that are readable by smartphones.

	 Massachusetts Institute of Technology (MIT) Review's <u>Covid Tracing Tracker</u> is a
	database that captures details (e.g., mandatory vs. voluntary, number of users and
	penetration rate, centralized vs. decentralized, data destruction, type of technology) of
	automated contact tracing efforts backed by national governments around the world. ^{10,e}
	Maintaining Surveillance and Capacity: Key factors that may have contributed to effective
	contact tracing include.
	\sim Mounting an early response. Many jurisdictions began implementing public health
	measures before the first imported case was detected (e.g., activating taskforces
	initiating testing among symptomatic international travellers) which enabled them to
	and a solution of the solution
	- Human recourse capacity for contact tracing: Although manual contact tracing is the
	o <u>inumati resource capacity for contact tracing</u> . Although manual contact tracing is the
	preferred approach, it is very resource-intensive and may rapidly become overwheimed.
	Human resource capacity for contact tracing in most jurisdictions was achieved through
	redeployment and training of employees and volunteers across governmental and non-
	governmental sectors (e.g., health care workers, medical students, armed forces,
	police). ¹²
	The number of contact tracers range from: five per 20,000 inhabitants in Germany
	(as of late April 2020), 52 contact tracers in Iceland (as of late March 2020), 200+ in
	New Zealand (as of May 29, 2020), 240 in San Francisco (as of late April 2020),
	700 in Singapore (as of late March 2020), and 1,800 teams, each with at least five
	members, in Wuhan, China (as of late February 2020). ^{13,14,15}
	Effectiveness: It may not be possible to directly attribute containment of the COVID-19
	epidemic to any single public health measure. Nonetheless, Singapore, Iceland, Taiwan,
	and South Korea did not impose a national lockdown, which supports at least partial
	effectiveness of contact tracing approaches. For instance, Taiwan and Singapore have had
	success in containing the outbreak without a lockdown initially and over time. Moreover,
	Iceland presents compelling evidence supporting the effectiveness of rigorous contact
	tracing to limit further transmission, with high rates of accurate identification of imported
	versus community-linked COVID-19 cases and those in isolation or guarantine. ¹⁶
	 Bluetooth, global positioning system, and cloud-based technologies may serve as
	useful tools for supporting contact tracing, particularly in densely populated areas where
	not all contacts may be known to the infected individual. ¹⁷
	 However, due to privacy and usability concerns, digital contact tracing tools may
	best serve as supplementary measures to traditional contact tracing. This approach
	has been recommended by the World Health Organization ¹⁸
Canadian	The Public Health Agency of Canada developed guidance for federal/provincial/territorial
Scan	public health authorities to support the management of cases and contacts of COVID-19
	within their jurisdictions. It includes recommendations for frequency and type of follow-up
	stratified by exposure risk level (low medium or high) ¹⁹
	$_{\odot}$ For example British Columbia (May 15, 2020) and Nova Scotia (May 22, 2020) have
	issued interim quidance on case and contact management for COVID-19 20.21
	 Only one province was identified that has moved towards using a digital contact tracing
	annroach
	գրութագոր

^e The tool does not keep track of the underlying protocols that will feed into apps, early-stage initiatives to build new products, experimental apps that have no government backing or connection to public health services, or manual contact tracing efforts (<u>MIT Technology Review, May 7, 2020</u>).

• Alberta's <u>ABTraceTogether</u> is a mobile contact tracing app using Bluetooth that can be
voluntarily downloaded by users to let them know if they have been exposed to or have
exposed others to COVID-19. It is a tool to complement traditional manual contact
tracing completed by public health officials who work at Alberta Health Services (AHS)
Porcenal data is only stored on the user's phone for 21 days in an operunted format: it
reisonal data is only stored on the dser's phone for 21 days in an encrypted format, it
can only be shared with AHS contact tracers with the user's permission. ²²
• The Canadian firm, BlueDot, [†] disseminates near-real-time insights on COVID-19
movements to clients, including governments, hospitals, and airlines, based on over 40
pathogen-specific datasets reflecting disease mobility and outbreak potential. ²³
On April 27, 2020, the Government of Ontario released its <u>framework document</u> for
reopening the province, echoing the need to strengthen public health capacity for rigorous
testing, timely contact tracing, and case management. ²⁴
\circ One of the criteria being considered for determining when to ease public health
measures and for ongoing monitoring of progress is that approximately 90% of new
COVID 10 contacts are being reached by least within health efficials within and dev
COVID-19 contacts are being reached by local public health officials within one day,
with guidance and direction to contain community spread. ²⁵
Public Health Ontario, in collaboration with the Ministry of Health and the federal
government, is leading the <u>COVID-19 Contact Tracing Initiative</u> . To date, contact tracing is
led by Ontario's public health units, but additional capacity is required because of the rising
number of cases and contacts to manage. ²⁶

^f BlueDot specializes in automated infectious disease surveillance and uses machine learning and natural language processing techniques to sift through news reports in 65 languages, forum and blog posts, airline ticketing data, animal disease networks, and other sources to pick up indications and news of unusual, unfolding events and possible disease outbreaks. The firm employs trained epidemiologists to further analyze outbreak results obtained by automated means before releasing them to its clients (<u>BlueDot; June 1, 2020</u>).

<u>Methods</u>

The COVID-19 Evidence Synthesis Network is comprised of groups specializing in evidence synthesis and knowledge translation. The group has committed to provide their expertise to provide high-quality, relevant, and timely synthesized research evidence about COVID-19 to inform decision makers as the pandemic continues. The following members of the Network provided evidence synthesis products that were used to develop this Evidence Synthesis Briefing Note:

- Bhatia, D., Morales-Vazquez, M., Song, K., Roerig, M., Allin, S., & Marchildon, G. (May 2020). <u>COVID-19 Case and Contact Tracing: Policy Learning from International Comparisons</u>. Toronto: North American Observatory on Health Systems and Policies. *Rapid Review* (No. 30).
- Dulong, C., & Severn, M. (May 1, 2020). <u>Contact Tracing for Potential Exposure to SARS-CoV-2</u> <u>Virus: Guidelines</u>. The Canadian Agency for Drugs and Technologies in Health.
- Ontario Health (Cancer Care Ontario). (May 18, 2020). Personal Communication to Research, Analysis and Evaluation Branch.
- Ontario Health (Quality). (May 18, 2020). Personal Communication to Research, Analysis and Evaluation Branch.
- Unity Health St. Michael's Hospital. (May 18, 2020). Personal Communication to Research, Analysis and Evaluation Branch.

For more information, please contact the Research, Analysis and Evaluation Branch (Ministry of Health).

APPENDIX

Table 2: Summary of the Case Studies on Six Jurisdictions regarding Testing, Case Management, and Contact Tracing²⁷

	Germany
Date of first case	January 28, 2020
Total cases /	168,551 cases / 7,369 deaths (total population of over 83 million)
deaths (May 2020)	
Party responsible	Robert Koch Institute (RKI) oversight, including guidelines and recommendations; contact tracing implemented
for testing and	through 375 local public health units.
contact tracing	
Testing criteria	Laboratory testing is recommended for individuals with:
	Acute respiratory tract infection and history of close contact with a confirmed or probable case in 14 days prior to symptom onset
	 Clinical or radiologic characteristics of viral pneumonia in the context of increased number of pneumonias in care facilities or hospitals
	 Clinical or radiologic characteristics of viral pneumonia with no indication of any other cause, and no contact with a confirmed case.
	 Acute respiratory tract infection and (a) history of medical related activities, (b) a pre-existing medical condition, or (c) no known risk factors.
	German residents are encouraged to immediately, irrespective of symptoms, contact their health office, get in touch with a doctor or call the non-emergency medical service, and stay at home if they have contact with a person with confirmed SARS-CoV-2 infection. The operator from the non-emergency medical service decides whether testing is warranted and discusses the next steps.
Testing capacity	End of April: 141.815 tests per day or 860.494 tests per week.
	 May 13: 157,150 tests per day or 1,038,223 tests per week.
	 PCR test processing: 134 laboratories of university hospitals, research institutions, and clinical and
	outpatient settings were equipped for processing samples on May 13.
	Testing capacity has both been increasing with the regard to the number of laboratories equipped to
	process the tests and the number of tests processed per laboratory.
	Total of 3,147,771 tests have been performed in Germany by May 13.
Contact definition	There are three categories of contact with specific follow-up instructions for each. Broadly, close contacts are
	defined as:
	Speaking to the confirmed case for at least 15 minutes; or
	Being coughed or sneezed on at a time when the confirmed case was infectious (i.e., 2 days before
	symptom onset).
Contact tracing	1. Local public health unit registers positive SARS-CoV-2 test result.
and case	2. Contact tracing team situated within the public health unit calls the infected individual to communicate test
management	results and inquire about any contacts that occurred in the 2 days preceding symptom onset.
process	3. Due to strict privacy laws, the use of digital tools to support contact tracing is not widespread; SORMAS
	app is used by public health units to contact exposed individuals in Berlin; Corona App (Bluetooth exposure
	notification app) is in development.
	4. Contacts are called by contact tracers and informed of exposure. Contacts are classified into 3 categories,
	depending on the nature of exposure. Recommendations vary depending on contact category, but
	generally, they are advised to isolate for 14 days.
	5. Contacts' symptoms are monitored through regular calls from contact tracers; if symptoms develop or
	worsen, individuals are advised to call a health office or a non-emergency medical service hotline to
	determine whether a test may be warranted.
	6. It individuals are unable to leave the house, public health units or outreach teams of ambulatory physicians
	may dispatch a healthcare worker to perform the diagnostic test at the individual's home.

	7. Some cities use "corona taxis", in which healthcare providers and medical students visit confirmed cases in
	their homes to monitor their symptoms, perform a medical exam, and escalate management if necessary
	(i.e., transfer the patient to the hospital).
	8. Voluntary smartwatch app "Corona Data Donation", released in early April, allows cases to record their
	symptoms alongside other biometrics; when aggregated at zip code level, these data may help identify
	"hotspots" (see Appendices C and D for detail).
Contact tracing	Germany's goal is to have a team of 5 contact tracers per 20,000 inhabitants (amounting to 21,000
capacity	individuals nationally).
	• To meet this capacity goal, medical students, healthcare workers, and public employees from other areas of
	the bureaucracy have been redeployed into contact tracing teams, with additional assistance from the
	armed forces in the most affected areas.
Effectiveness of	 Germany's viral basic reproduction factor (R0) was estimated to be at 0.76 on May 5.
contact tracing	This change may not be attributed to testing and contact tracing alone, as Germany implemented border
	closures and large-scale restrictions throughout early to mid March.
	Iceland
Date of first case	February 28, 2020
Total cases /	1,801 cases / 10 deaths (total population of over 360,000)
deaths (May 2020)	
Party responsible	Department of Civil Protection and Emergency Management (National Commissioner of Icelandic Police) in
for testing and	collaboration with Directorate of Health and Chief Epidemiologist, mandated by the Minister of Health.
contact tracing	
lesting criteria	I hose presenting with symptoms (any severity) should contact their primary care clinic or call a designated
	neipline to determine whether a test is warranted, based on physician judgment.
	Healthcare workers and persons whose medical history may put them at risk of experiencing more severe
Testing consoits	Symptoms are prioritized for testing.
resting capacity	Outpreak peak (March-April): 1,000 tests per day.
	 Current, 500 tests per uay. Toeta dana autoida primary corra alinica en a drive through basia.
	 Tests uone outside primary care clinics on a drive-infough basis. Total of 51 663 tests completed (1/1 031 tests per million individuals)
	 DCD test processing: 1 central lab (National University Hespital in Devkjavík, NUHI)
	 Test results turnaround time: 24 hours
Contact definition	 Test results full about time. 24 hours. Individuals that within the 14 days preceding diagnosis, have been within 1-2 meters of:
Contact demittion	 A symptomatic person
	A confirmed case
Contact tracing	Contact tracing team within Civil Protection Department receives test results from NUHI
and case	2 Contact tracers call the infected individual to administer a questionnaire re: 14-day history before
management	symptoms onset (dates, locations, individuals contacted).
process	3. For unknown contacts, use: police records, travel records, open source info (e.g., social media), employer
•	of the patient (if relevant/available).
	4. Voluntary app "Ranking C-19", released in early April, tracks the user's 14-day GPS history; upon COVID-
	19 diagnosis, user may submit these data to the contact tracing team to supplement efforts to identify
	unknown contacts (see Appendices C and D for detail).
	5. Contacts are instructed to quarantine for 14 days immediately.
	6. Time to trace all contacts: 8 hours (March); 2 hours (May).
	7. Contacts' symptoms monitored with regular calls from the contact tracers; if symptoms develop, individuals
	advised to call primary care clinic or helpline to determine if test is warranted.
	o. It diagnosed, individuals isolate primarily at nome. Those unable to isolate sately at nome may book a hotel
Contact tracing	room. Hotels also available for foreign workers and nouseless individuals.
contact tracing	Early March: team of 6 individuals (detectives, criminologists, healthcare workers)
	Current (way): 52 Individuals (civil servants, nealthcare workers, students)
Effectiveness of	Invay by each of 1,799 cases confirmed up to that point identified as either imported or community-linked.
contact tracing	 way 12. 19,094 individuals nave completed a 14-day quarantine, 564 were in quarantine, 18 were in isolation, and 1 was bosnitalized (no ICLI).

Ontario

	11. Current: mild cases isolate at home or in "Corona hotels" rented by the Ministry of Health. Those in LTC
	quarantine in designated LTC units while awaiting test results. All severe cases or those with concurrent medical issues are taken to hospitals
Contact tracing	In emergency times, Health Bureaus can recruit nurses from district-level mother and child centers to aid
capacity	contact tracing.
Effectiveness of	Late April to early May: daily number of new cases consistently fell below 100 and number of those
contact tracing	recovered has surpassed the number of those actively ill.
	mid-April high of 23 cases per 10.000 people to 15 per 10.000.
	These changes may not be attributed to testing and contact tracing alone, as Israel implemented border
	closures and large-scale restrictions throughout early to mid March.
Data of first sage	Singapore
Total cases /	21 707 cases / 20 deaths (total nonulation of over 5.6 million)
deaths (May 2020)	
Party responsible	Ministry of Health responsible for testing and contact tracing, in close collaboration with hospitals, Certis
for testing and	security (private auxiliary police force), Singapore Police Force, and Singapore Civil Defense Force.
contact tracing	Multi-Ministry Taskforce created to manage COVID-19 oversees these processes.
lesting criteria	The following individuals are prioritized for testing:
	 Those with symptoms of acute respiratory infection and/or:
	 History of close contact with a confirmed COVID-19 case; and/or
	 Recent travel history.
	All individuals experiencing respiratory symptoms of any severity are advised to visit a primary care physician
	for close monitoring; it symptoms do not resolve after 5 days, individuals may be referred for further investigation and possible testing. Singapore's 900 Public Health Preparedness Clinics (PHPC) are the first
	point of contact for symptomatic persons. PHPCs are regular primary care practices whose clinicians and staff
	are trained in emergency outbreak protocols; this function of the clinics is activated during public health
	emergencies.
	Mass testing in special groups:
	All 30,000 adult residential care home staff and residents (housing the elderly, houseless individuals, and
	those with disabilities).
	Residents of foreign worker dormitories. As of late April, 21,000 individuals have been tested (3,000
Testing conseity	individuals per day or 6,500 individuals per 100,000).
resting capacity	Early April: 2,900 tests per day. Current (late April to early May): 8 000 tests per day.
	 By June/July test rate expected to increase to 40 000 tests per day.
	 Total of 2,100 per 100,000 persons tested.
	Tests done in acute care hospitals and the National Centre for Infectious Diseases (NCID).
	PCR processing: tests processed in laboratories within public hospitals and the National Public Health
	Laboratory in NCID. The Multi-Ministry Taskforce scaled up processing capacity by repurposing private and
	 While awaiting test results, individuals are advised to self-isolate in their homes
	 Those unable to safely isolate at home are directed to Swab Isolation Facilities (repurposed hotels with
	4,000 bed capacity).
	Those with severe symptoms or concurrent health conditions are isolated at hospitals.
Contact definition	Contact with individual with diagnosed COVID-19 within 2 meters of distance for 30 minutes or more.
Contact tracing	1. Contact tracing starts at the hospital; healthcare worker interviews the patient with COVID-19 about their history up to 14 days before symptome (leastions dates times individuals contacted)
management	2 An "activity man" is produced and submitted by the hospital to the Ministry of Health
process	3. Contact tracing team at the Ministry of Health verifies the map by calling the patient and their family/
	friends, and reviewing transport records; full activity map is charted within 24 hours of diagnosis.

	4. For unknown contacts, contact tracers review the activity maps of other confirmed cases and flag linkages
	as hypotheses.
	5. Hypotheses are then proven of disproven through phone interviews with the other cases and held investigations (a.g., streat curvey, review of CCTV feature), which may involve apagement of the Police
	Force
	6 Voluntary ann "TraceTogether" released late March, records anonymized identifiers of nearby phones
	over 21 days via Bluetooth: upon diagnosis user may submit these data to the contact tracing team to
	supplement efforts to identify unknown contacts (see Appendices C and D for detail)
	7 SafeEntry OR code check-in/check-out system added to public venues in early May to enable identification
	of contacts in case of an outbreak (see Appendices C and D for detail).
	8. Identified contacts are called and screened for symptoms. Those who are asymptomatic are advised to
	guarantine for 14 days (from the time of exposure).
	9. Symptoms and guarantine adherence are monitored via regular calls from Ministry of Health official
	10. Contacts with symptoms are treated as "suspect cases" and may be transported to hospital for testing.
	11. Time to trace all contacts: 48 hours after patient diagnosis.
	12. Depending on symptom severity and medical history, cases and contacts may quarantine/isolate at home
	or at government facilities. Only the most severe cases are admitted to hospitals.
Contact tracing	Ministry of Health epidemiologists and communicable disease experts train and supervise contact tracing
capacity	teams, composed of redeployed personnel (e.g., medical residents, volunteers from other departments, Civil
	Defense officers).
	February: 5 teams of 10 contact tracers (500 individuals).
	Late March: 7 teams of 10 contact tracers (700 individuals).
	There are 3 contact tracing teams on duty during any single shift, and 2 contact tracing shifts per day.
	April 21: To facilitate rapid triaging, case finding, and contact tracing within foreign worker dormitories, on
	Taskforce has deployed Forward Assurance and Support Teams (FAST Teams).
	Hotels, university hostels, and convention centers converted to quarantine facilities (500-10,000 bed
	capacity); by end of June, capacity expected increase to 20,000 beds.
	Over 200 Certis security services officers deployed to quarantine facilities to assist with check in and check
	out processes and monitor adherence.
Effectiveness of	• Contact tracing was the primary method of containment in Singapore until early April, when the number of
contact tracing	cases began increasing due to outbreaks in foreign worker dormitories, at which point a large-scale "circuit
	breaker restrictions were imposed.
	May 2: average number of new cases was 12 per day. South Korea
Date of first case	January 20, 2020
Total cases /	10.936 cases / 258 deaths (total population of over 51.6 million)
deaths (May 2020)	
Party responsible	Korean Centers for Disease Control (KCDC) and Prevention within the Ministry of Health and Welfare.
for testing and	
contact tracing	
Testing criteria	Patients classified as suspected cases and Patients Under Investigation (PUI) may get testing:
	Suspected cases are those at high-risk of having been in close contact with a confirmed patient, who
	developed symptoms within 14 days of contact.
	PUIs include those suspected to be a case due to (I) pneumonia of unknown causes, (ii) a fever or
	respiratory symptoms that occurred within 14 days of traveling to a country with local COVID-19
	transmission, or (iii) an epidemiological link to the collective outbreak of COVID-19 in Korea and presence of
Testing consoity	Symptoms.
resting capacity	 February, 5,000 tests per day. March: 19,000 tests per day.
	 Indicit. 10,000 tests per day. Consolity increase attributed to the increase in disgnestic respect companies approved by the reverse statement.
	 Gapacity increase attributed to the increase in diagnostic reagent companies approved by the government under omergeney use authorization (5 companies approved); under the authorization tests were distributed.
	not only to the 18 public health labs, but also private labs (which previously needed a lengthy authorization
	nrocess) By late January nearly 200 Jahoratories 600 testing centers and numerous private clinics had
	access to the government-approved test kits.

	May: Total of 680,890 tests completed, 569 active testing centers across all 9 provinces and 55 drive- through testing facilities in Z out of 0 provinces
Contact definition	Close contact with a confirmed case, who developed symptoms within 14 days of contact
Contact tracing	Liose contact with a committee case, who developed symptoms within 14 days of contact.
and case	n. In cases of widespread italismission, local (rather itian central) epidemiological investigation teams
anu case	periori condiction and a second s
management	
process	I distribution toute.
	5. Risk assessment, the conected information is vernied and supplemented by other sources (medical records, control of the conected information of the conected informatio
	Tecoros, cenular GPS data, credit card transactions, CCTV rootage).
	4. Contacts are classified by this status (close vs. casual contact).
	5. Contacts are then reached by the epidemiological team, informed of their exposure, and counseled
	regarding next steps (sell-quarantine and symptom monitoring).
	b. Inrough collaboration with the Ministry of Land, intrastructure and Transport, National Police Agency,
	Credit Finance Association of Korea, 3 telecommunication and 22 credit card companies, the Korean
	Centre for Disease Control and Prevention developed a COVID-19 data platform; this system draws on
	real-time GPS, mobile, and credit card transaction information to perform a spatio-temporal analysis. This
	automated "big data" approach allows to rapidly verify patient reporting and identity infection clusters.
	7. This approach reduced the 24-hour manual contact analysis to a 10-minute automated one.
Contact tracing	NOT DISCUSSED.
capacity	
Effectiveness of	The number of new cases in South Korea stayed primarily in the single digits between mid-April and early May.
contact tracing	Given its proximity to high-incidence settings and a lack of a widespread lockdown, the decrease in cases can
	likely be attributed to the country's effective testing and contact tracing practices.
	Taiwan
Date of first case	January 21, 2020
Total cases /	440 cases / 6 deaths (total population of nearly 24 million)
deaths (May 2020)	
Party responsible	I aiwan Centers for Disease Control (CDC) in coordination with the National Health Command Center.
for testing and	
contact tracing	
lesting criteria	All suspected cases are tested, defined as individuals who were in close contact with a symptomatic confirmed
	case within 14 days prior to symptom onset, and who present one or more of the following:
	 Fever (≥ 38) or symptoms of acute respiratory tract infection.
	Abnormal sense of smell or taste, or diarrhea of unknown etiology.
	 Community-acquired pneumonia highly suspected to be COVID-19 by doctors.
	High-risk groups identified for increased surveillance:
	Elderly
	Individuals with comorbidities.
	The first point of contact and triage centre for mild symptomatic cases is the network of Community Healthcare
	Groups Prepared Clinics (CHGPC). These clinics do not perform testing, but determine whether testing is
	warranted.
Testing capacity	April 7: CDC announced establishment of a national testing network of 34 laboratories to expand testing
	capacity and reduce waiting times for test results.
	This resulted in a testing rate of 3,800 tests per day in different settings across Taiwan.
Contact definition	Individual that had close (less than 2 meters) face-to-face contact for more than 15 minutes with a confirmed
	COVID-19 case before they received a diagnosis.
	• In healthcare settings, contacts are medical staff, hospital workers, or other patients that had close contact
	(less than 2 meters) with a confirmed case for a longer duration than required, without protective equipment.
Contact tracing	1. The National Health Insurance (NHI) database was a key method of contact tracing in Taiwan. The
and case	database contains complete health history, underlying health conditions, recent progression of symptoms,
management	treatments, and hospitalization related to respiratory syndrome.
process	

	2. The NHI Cloud was enriched with patients' 14-day travel history using the Customs and Immigration data of
	the National Immigration Agency. All hospitals, clinics, and pharmacies in Taiwan have access to patients'
	travel histories.
	3. The NHI-based centralized Taiwan Health Cloud program generates automatic surveillance reports for
	infectious diseases using hospital electronic medical records.
Contact tracing	Not discussed.
capacity	
Effectiveness of	Despite its proximity to high-incidence settings and a lack of a national lockdown, Taiwan achieved the
contact tracing	lowest incidence of COVID-19 cases per capita globally by late March.
	May 1: Taiwan achieved a rate of zero new cases in six consecutive days.

Figure 1: Summary of the Features of Contact Tracing Digital Approaches across Six Jurisdictions²⁸

		<u> </u>		J									
Jurisdiction	Name	Launch date	Device	Tech	Data collected	Data access	Data period	Data storage	Developer	Open source protocol	Mandatory/voluntary	Uptake	Action
Germany	Corona app	June 2020 (expected)	Smartphone (iOS + Android)	Bluetooth, Google/ Apple	Time-linked temporary anon'd IDs of nearby phones, self-reported dx	User only	Unclear	Local (on device)	HA + private partner	Yes (DP-3T)	Voluntary installation for user	NA (need 50% pop'n)	In-app exposure alert
Germany	Corona Data Donation app	April 7, 2020	Fitness wristbands/ smartwatches(iOS + Android)	App algorithms	User-assigned pseudonym, app recognized COVID- 19 related symptoms, postcode	User + HA	10 years (can be deleted by the user)	HA server + Local (on device)	HA + private partner	Unclear	Voluntary installation for user	8% of pop'n	No user alert, data transferred constantly, with consent
Germany	SORMAS	April 20, 2020	Smartphone (iOS + Android)	Software	Dx, symptoms hx of patients in clinics	HA + other partners	Unclear	HA server	HA + other partners	ſYes	Voluntarily for clinics	One district in Berlin	No user alert, identification of cases and contacts
Iceland	Rakning C-19	April 2, 2020	Smartphone (iOS + Android)	GPS	User phone number, device location hx	User + HA with consent, if user dx	14 days (destroyed on rolling basis)	HA server: user phone number Local (on device): device location hx	HA + private partner	No	Voluntary installation for user	38% of pop'n	No user alert, data transferred if dx, with consent
Israel	Shin Bet cellphone tracking	March 15, 2020	Cellphone	Unclear	Device location, credit card records	User + HA	14 days (unclear if destroyed)	HA	Shin Bet security service	No	Mandatory for user, no installation	Unclear	SMS exposure alert, self- quarantine, self- report to HA
Israel	HaMagen	March 22, 2020	Smartphone (iOS + Android)	GP8	Device location hx	User only	14 days (destroyed on rolling basis)	Local (on device)	HA + private partner	Yes	Voluntary installation for user	17% of pop'n	In-app exposure alert, self- quarantine, self- report to HA
Singapore	TraceTogether	March 20, 2020	Smartphone (iOS + Android)	Bluetooth	User phone number, time-linked temporary anon'd IDs of nearby phones	User + HA with consent, if user dx	21 days (destroyed on rolling basis)	HA server: user phone number	HA+ GovTech	Yes (BlueTrace)	Voluntary installation for user	13% of pop'n	No user alert, data transferred if dx, with consent

								Local (on device): anon'd IDs					
Singapore	SafeEntry	May 9-12, 2020	Smartphone or gov't ID card with barcode	QR code or gov't ID card with barcode	User name, NRIC/FIN, user phone number	HA	Unclear	HA	HA+ GovTech	Unclear	Mandatory for venues, no user installation	16,000 venues (rollout ongoing)	No user alert
South Korea	Self-health check app	February 12, 2020	Smartphones (iOS + Android)		Self-report symptoms	User + public health authorities	14 days				Mandatory		
South Korea	Self-quarantine safety protection	March 20, 2020	Smartphones (iOS + Android)	GPS	Citizen location information, credit card data	User + public health authorities	14 days		Ministry of the Interior and Safety		Mandatory for in-bound travellers (incl. Korean nationals) and voluntary for Korean residents	91.4% of quarantined individuals	
Taiwan	Big Data	January 27, 2020	NA	Health Cloud	Dx, symptoms hx, travel history, full health records	HA + health settings + pharmacies	Unclear	National centralized health cloud/server	HA	Unclear	Mandatory	100% pop'n	Flag health records or high- risk patients
Taiwan	Entry Quarantine System	February 14, 2020	Smartphones (iOS + Android)	Online survey and SMS	Passport number, name, nationality, flight number, symptoms hx, phone number, landline, and address of quarantine location	HA	Unclear	HA	HA	Unclear	Mandatory	All incoming travelers	No user alert, data transferred to the Health Cloud
Taiwan	Electronic security monitoring system	February 14, 2020	Smartphones (iOS + Android)	GPS	Individual location information	HA + National Police Agency	Unclear	HA server	HA	Unclear	Mandatory	All individualism quarantine or self- isolation	Alert user and police authorities if quarantine is interrupted
Taiwan	Police cloud	February 14, 2020	NA	Police cloud	Information for criminal investigation (individual hx, places, photos, videos, vehicles)	National Police Agency (NPA)	Unclear	NPA cloud (M-cloud)	Unclear	Unclear	Mandatory	All individualism quarantine or self- isolation	No user alert, complements electronic security monitoring system

List of abbreviations: HA (Health Authority); GPS (global positioning system); NA (not applicable); dx (COVID-19 diagnosis); hx (history)
